

THE CHALLENGES OF INDUSTRIAL AND FACTORY FARMING

I chose three relatable food habits:

First: Climate changes related disasters: I'm not sure if this is a relatable habit of me but I think I kind of have to do with it. For example, I eat strawberries during winter session and that is a huge disaster for the climate. Because the strawberries do not grow during the winter session in Germany, they are brought from other countries by plane. That's why they are more expensive.

Now I want to talk about the food price fluctuations: I would also like to take strawberries as an example. During the Summer session they grow in Germany too that means they don't cost so much. I would say one to one fifty. But during the other sessions they don't grow in Germany, so they must be transported to Germany or other countries by the plane or ship based on. And that's cost a lot time, energy, CO2 and money.

Third one, huge waste in current food system: Imagine I go to the restaurant and I order a lot of food and dessert and drinks and all that stuff. And after I had aet my meal I released that I'm full I tell them I want to pay. And because I'm not obliged to eat everything are the workers in restaurants obliged to throw everything away. And that leads to a food waste
