B5: write a statement about your opinion on industrial farming!

"Industrial farming or small and ecological farming?"

I think this question is an important theme in our society. Because it's about our food. Or the way our food is purchased.

There are two faces about thinking. The one side says that with industrial farming it is possible for a growing world population to feed itself.

And that these are lower prices for the consumers.

This is a point I agree with. It is right that fairtrade or bio-products are more expensive and not everybody can afford it.

Another pro-argument for industrial farming is that machines can do more than human hands. Especially in a surtent time. But suppose there are no people to do the job. There'd be a lot of unemployed people.

So in my opinion there should be more produced by a ecological farm, because these points I said just now are the pro-arguments for industrial farming. And with that industrial farming did not convince me.

There are to much con-arguments.

For example: chemical input with pesticides, antibiotic[†] in animals, inhumane conditions for animals, amount of animal waste etc.

† hormone

These points are so bad! In the ecological farming ^(these points) are not spoken of.

One of the biggest pro-arguments of ecological farming is that it is believed that these small organic farming systems are good for our biodiversity, resilient and with that for our climate! Secondly this kind of art of farming helps poor communities to get money and feed themselves.

Moreover the ecological farming instituts use organic fertilisers and that's really good for the soil.

In Addition the smaller farmers try to get a better life for their livestock and also for water use.

And the last two points of the "Farmer Blog" Text was really convince me. It says: "By supporting ecological farmers you can help to repair our food system. [...] is goal for our society as a whole."

That's exactly what i think, that the food system in our society is just for a growing and big population.

They doesn't look after our climate, livestock and health four the people like the first con-arguments

So to sum it up, people should ^{buy} ~~buy~~ more in smaller locals or ecological instituts to help the climate, animals, health and to get the food system repair.
