

85. I think industrial farming is bad for environment. In factory farming of livestock so much methane arises. Methane is 25 times more bad for the climate than CO₂. Furthermore the slurry which is generated in factory farming generates nitrate which is toxic. That gets in our groundwater. Also the mass production of animals brings antibiotic resistant bacteria. They can be deadly.

Plant protection products are bad for environment. Glyphosat & co. are killing insects. There are 30% fewer bees in the U.S. in the last years.

I think we should eat less meat in general and we should spend more money for food that doesn't destroy the environment.
